BRIEF ON BEHALF OF APPELLANT

In support of the Notice of Appeal filed June 16, 2003, appealing the Examiner's final rejection mailed December 17, 2002 of each of pending claims 10-32 of the present application which appear in the attached Appendix, Appellant hereby provides the following remarks.

I. REAL PARTY IN INTEREST

The present application is assigned to Siemens Aktiengesellschaft of Munich,

Germany, by an Assignment recorded on September 19, 2000, Reel 011106, Frame

0835.

AUG 2 1 2003

II. RELATED APPEALS AND INTERFERENCES

TECHNOLOGY CENTER R3700

The undersigned, the Assignee and the Appellant do not know of any appeals or interferences which would directly affect or which would be directly affected or have a bearing on the Board's decision in this Appeal.

III. STATUS OF THE CLAIMS

Claims 10-32 are reproduced in the attached Appendix A and are the claims on Appeal. Each of these claims is currently pending in the application. Original claims 1-9 of the application were canceled during the prosecution of the application without prejudice or disclaimer of the subject matter contained therein.

IV. STATUS OF AMENDMENTS

Amendments dated March 17, 2003 and May 5, 2003 were filed with the U.S. Patent Office in response to the Final Rejection dated December 17, 2002, and are under consideration at this time.

TAKEN FROM THE APPLICATION:

V. SUMMARY OF THE INVENTION

The present application relates to a method, apparatus and system for operating an automatic component mounting unit that has a number 0f different mounting members and that is readily calibrated for optimally mounting a variety of different components onto a variety of different substrates. The automatic mounting unit of the present invention utilizes a number of members, such as, the component mounting head, feeding and sensor members, that can be readily adapted to a variety of different components and substrates.

In an embodiment, each of the members of the component mounting unit includes a respective data storage device. The data storage device stores and processes data that relates to each of the respective mounting members. In this way, the data can be processed by a control device of the component mounting unit for utilization during every stage of the component mounting operation.

In an embodiment, the data storage device stores a variety of different process or characteristic data, such as, the geometrical or positioning data that has been measured relative to a fixed reference. This data can then be utilized for readily calibrating one or more of the automatic component mounting members virtually upon immediate installation. To accomplish this virtual real-time calibration, the control

device communicates with the data storage device in order to configure the movement and positioning of the mounting member so that the mounting member is essentially ready for operation once it has been installed. In this way, the time-consuming calibration step subsequent to installation is effectively eliminated.

In an embodiment, the manufacturer identification codes of the different mounting members can be stored in the data storage device. This type of data is then processed by the control device for recognizing or identifying defective mounting members.

In a preferred embodiment, the functional or operational data of the mounting members is stored and processed by the control device via the data storage device for utilization during the component mounting operations. In this way, the control device can optimally control the operation of the component mounting members.

In an embodiment, the data exchange between the respective storage devices of each of the members and the control device occurs via electrical lines.

In an embodiment, a wireless data exchange occurs between the storage device and the control device. In this way, the process control equipment that is necessary for the operation of the automatic component mounting unit is minimized because additional electrical plug-connections are not required when a wireless data communication is utilized.

In a preferred embodiment, the mounting head member includes a number of holding elements, such as, suction pipettes or other like holding elements, in order to securely hold the component. Each of the suction pipettes includes a retracted and an extended position wherein the difference of the retracted and extended positions of each of the suction pipettes on the component mounting head can be calculated for

purposes of calibrating the component mounting head for precise and controlled mounting of the component on the substrate.

In a preferred embodiment, the data storage devices include a transponder device, that is, a device that can process characteristic data; i.e., read and write data, in a contactless manner and that does not require its own energy supply. In addition, the transponder devices can be readily integrated within each of the mounting members.

In an embodiment, the component mounting member includes a component mounting head member, a component feeding member, a component sensor member or other like member. Each of the mounting members has a respective data storage device that stores process data which is specific to its respective mounting member. The process data varies with respect to the type of component that is to be mounted.

VI. ISSUES

- i. Whether or not claims 10, 12-24, 26, 29, and 30 are anticipated under 35 U.S.C. § 102(b) by U.S. Patent No. 5,402,564 to Tsukasaki;
- ii. Whether or not claims 11 and 25 are unpatentable under 35 U.S.C. § 103(a) by U.S. Patent No. 5,588,195 to Asia;
- iii. Whether or not claims 27, 28, 31, and 32 are unpatentable under 35 U.S.C. § 103(a) by U.S. Patent No. 5,402,564 to Tsukasaki in view of U.S. Patent No. 5,588,195 to Asia, and further in view of U.S. Patent No. 6,002,650 to Kuribayashi.

VII. GROUPING OF THE CLAIMS

Appellant respectfully requests, for the purposes of this Appeal, that the grouping of the claims be as follows:

Group (i) including claims 10-17, and 16-18;

Group (ii) including claims 15, 19, 20, and 21; and

Group (iii) including claims 22-32.

VIII. ARGUMENTS

A. Rejection Under 35 U.S.C. § 102

The Examiner has rejected claims 10, 12-24, 26, 29, and 30 under 35 U.S.C. § 102(b) as being anticipated by Tsukasaki, U.S. Patent No. 5,402,564 (the Tsukasaki '564 patent). Appellant respectfully submits that the aforementioned claims are not anticipated by the Tsukasaki '564 patent for reasons expressed hereafter.

TAKEN FROM 3-17-03 AMENDMENT:

In the Examiner's Office Action, the Examiner alleges that, in col. 8, lines 34-62, Tsukasaki et al. discloses a plurality of mounting members each including a storage device. However, Applicants respectfully note that the storage device 503 according to Tsukasaki et al., is not a storage device of the mounting members 200, but is a storage device of the controller 500 (noting that the passage mentioned by the Examiner indicates that the controller 500 comprises...storage portion 503..."). Further, in Tsukasaki et al., it is taught to store information regarding where components have to be placed and to control placement of the components. This is clearly contrary to the present invention as claimed, as will be explained as follows.

With regard to claim 10 of the present application, for example, the claim sets forth an automatic component mounting unit comprising a plurality of mounting members "each of said mounting members including a respective data storage device". Thus, Applicants have not claimed a single data storage device used in conjunction with all mounting members, but instead, have claimed a respective data storage device for each of the mounting members.

Further, as additionally set forth in claim 10, each of the data storage devices transmits an amount of mounting process data, wherein the mounting process data "is utilized so as to adapt each of said mounting members for optimal use during said mounting of said electrical component". Thus, not only does each mounting member include a storage device associated therewith, but the storage device stores information which adapts the mounting member for optimal use during mounting of electrical components. As such, it is possible to interchange any mounting member, which can be a mounting head, feeding member, sensor, etc., without the need of calibrating the whole mounting apparatus. This is further discussed on page 3 of the original application.

Applicants respectfully submit that Tsukasaki et al. fails to teach or suggest a plurality of mounting members, "each of said mounting members including a respective data storage device" as set forth in claim 10, as well as each of the data storage devices transmitting an amount of mounting process data, wherein "said amount of mounting process data is utilized so as to adapt each of said mounting members for optimal use during said mounting of said electrical component". Tsukasaki et al. is merely directed to controlling the mounting members, and does not include mounting

members with separate storage devices, which can essentially be interchanged and reset for optimal use, without the need to calibrate whole apparatus. Thus, in addition to the arguments previously set forth, Applicants respectfully submit that claim 10 of the present application is even further patentable over Tsukasaki et al.

With regard to claim 22, Applicants note that claim 22 has been amended to clarify that each of the mounting members include a respective data storage device, and to clarify that mounting process data is adapted to be stored in the data storage devices and is utilized to adapt each of the mounting members for optimal use during the mounting of an electrical component, somewhat similar to that of claim 10. Accordingly, claim 22 is also allowable over Tsukasaki et al.

Finally, with regard to claim 15, this claim also claims a plurality of mounting members, "each of said members includes a respective data storage device for storing an amount of process data", wherein said control device utilizes "said amount of process data so as to readily adapt each of said mounting members for optimal use upon installation of each of said mounting members to said automatic component mounting unit". Accordingly, at least such limitations are not taught or suggested by Tsukasaki et al.

Accordingly, Applicants respectfully submit that each of pending independent claims 10, 15 and 22 of the present application are clearly allowable over Tsukasaki et al., taken alone or in combination with any of the references. Accordingly, withdrawal of the Examiner's rejection is respectfully requested. With regard to each of the dependent claims, these claims are allowable for at least the reasons previously set forth regarding their corresponding independent claims.

B. Rejections Und r 35 U.S.C. § 103

The Examiner has rejected claims 11 and 25 under 35 U.S.C. § 103(a) as being unpatentable by the Tsukasaki '564 patent in view of Asia, U.S. Patent No. 5,588,195 (the Asia '195 patent). Appellant respectfully submits that the aforementioned claims are not anticipated by the Tsukasaki '564 patent or the Asia '195 patent for reasons expressed hereafter.

The Examiner has rejected claims 27, 28, 31, and 32 under 35 U.S.C. § 103(a) as being unpatentable by the Tsukasaki '564 patent in view of the Asia '195 patent, and further in view of Kuribayashi, U.S. Patent No. 6,002,650 (the Kuribayashi '650 patent). Appellant respectfully submits that the aforementioned claims are not anticipated by the Tsukasaki '564 patent, Asia '195 patent, or the Kuribayashi '650 patent for reasons expressed hereafter.

TAKEN FROM 3-17-03 AMENDMENT:

These rejections are respectfully traversed, in that, even assuming *arguendo* that either one or both of Kuribayashi or Asia could be combined with Tsukasaki et al., which Applicants do not admit, each of the aforementioned references would still fail to make up for the aforementioned deficiencies of Tsukasaki et al. Accordingly, at least for the reasons previously set forth regarding their corresponding independent claims, Applicants respectfully submitted that dependent claims 11, 25, 27, 28, 31 and 32 are allowable over the prior art of record. Accordingly, withdrawal of the Examiner's rejections is respectfully requested.

IX. CONCLUSION

It is respectfully submitted that the rejections of each of pending claims 10-32 as being unpatentable under 35 U.S.C. § 102 over the Tsukasaki '564 patent, and/or as being unpatentable over the Tsukasaki '564 patent in view of the Asia '195 patent, and/or as being unpatentable over the Tsukasaki '564 patent in view of the Asia '195 patent and further in view of the Kuribayashi '650 patent, is in error and should be reversed. Appellant respectfully submits that the Examiner has ignored many limitations present in the various claims and has ignored preambles of the claims which are legally limiting and which establish at least part of the claims meaning or significance. Accordingly, for at least the aforementioned reasons, Appellant respectfully requests the Honorable members of the Board of Patent Appeals and Interferences to reverse each of the outstanding rejections in connection with the present application and permit each of claims 10-32 to be allowed in connection with the present application.

Should there be any outstanding matters that need to be resolved in the present application, the Examiner is respectfully requested to contact Donald J. Daley, Reg. No. 34,313 at the telephone number of the undersigned below.

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 08-0750 for any additional fees required under 37 C.F.R. § 1.16 or under 37 C.F.R. § 1.17; particularly, extension of time fees.

Respectfully submitted,

HARNESS, DICKEY, & PIERCE, P.L.C.

Appendix -- Clean version of pending claims

APPENDIX

10. An automatic component mounting unit for mounting an electrical component onto a substrate of an electrical assembly, comprising:

a plurality of mounting members disposed for mounting said electrical component, each of said mounting members including a respective data storage device, wherein each of said data storage devices stores an amount of mounting process data related to a fixed reference mark, for each of said respective mounting members; and

a control device disposed for controlling said automatic component mounting unit, each of said data storage devices transmitting said amount of mounting process data to said control device, wherein said amount of mounting process data is utilized so as to adapt each of said mounting members for optimal use during said mounting of said electrical component.

- 11. An automatic component mounting unit according to claim 10 wherein each of said data storage devices includes a transponder unit for communicating with said control device in a contactless manner, and wherein said transponder unit is directly attached to each of said mounting members.
- 12. An automatic mounting unit according to claim 10 wherein said mounting members include a mounting head member.
- 13. An automatic mounting unit according to claim 10 wherein said mounting members include a mounting feeding member.

- 14. An automatic mounting unit according to claim 10 wherein said mounting members include a mounting sensor member.
- 15. A system for operating an automatic component mounting unit for mounting an electrical component onto a substrate of an electrical assembly, comprising:

a plurality of mounting members installed for mounting said electrical component, wherein each of said members includes a respective data storage device for storing an amount of process data related to a fixed reference mark; and

a control device disposed for communicating with each of said data storage devices for processing said amount of process data, wherein said control device utilizes said amount of process data so as to readily adapt each of said mounting members for optimal use upon installation of each of said mounting members to said automatic component mounting unit.

- 16. An automatic component mounting unit according to claim 10, wherein the mounting process data includes at least one of geometrical and positioning data measured relative to a fixed reference mark.
- 17. An automatic component mounting unit according to claim 10, wherein said control device receives said amount of mounting process data to configure movement and positioning of the plurality of mounting members.

- 18. An automatic component mounting unit according to claim 16, wherein said control device receives said amount of mounting process data to configure movement and positioning of the plurality of mounting members.
- 19. A system as claimed in claim 15, wherein said amount of process data includes at least one of geometrical and positioning data measured relative to a fixed reference mark.
- 20. A system as claimed in claim 15, wherein said control device receives said amount of process data to configure movement and positioning of the plurality of mounting members.
- 21. A system as claimed in claim 19, wherein said control device receives said amount of process data to configure movement and positioning of the plurality of mounting members.

22. An automatic component mounting unit for mounting an electrical component onto a substrate, comprising:

a plurality of mounting members disposed for mounting an electrical component, wherein each of said mounting members includes a respective data storage device, adapted to store mounting process data related to a fixed reference mark; and

a control device, adapted to control said plurality of mounting members, wherein the mounting process data is utilized by the control device so as to adapt each of the mounting members for optical use during the mounting of an electrical component.

- 23. The automatic component mounting unit of claim 22, further comprising a mounting head member, including the plurality of mounting members.
- 24. The automatic component mounting unit of claim 23, wherein the mounting head member includes a storage device for storing the mounting process data.
- 25. The automatic component mounting unit of claim 24, wherein the storage device is a transponder, adapted to communicate with the control device in a contactless manner.
- 26. The automatic component mounting unit of claim 22, wherein the mounting process data is transferred from a data storage medium.

- 27. The automatic component mounting unit of claim 23, wherein the mounting process data is stored on a data storage medium, insertable into at least one of the mounting head member and control device.
- 28. The automatic component mounting unit of claim 22, wherein the mounting process data is stored on a data storage medium, insertable into the control device.
- 29. An automatic component mounting unit according to claim 22, wherein the mounting process data includes at least one of geometrical and positioning data measured relative to a fixed reference mark.
- 30. An automatic component mounting unit according to claim 22, wherein said control device receives said amount of mounting process data to configure movement and positioning of the plurality of mounting members.
- 31. An automatic component mounting unit according to claim 27, wherein the mounting process data includes at least one of geometrical and positioning data measured relative to a fixed reference mark.
- 32. An automatic component mounting unit according to claim 27, wherein said control device receives said amount of mounting process data to configure movement and positioning of the plurality of mounting members.
